Table 2. Terminology and *International Classification of Diseases* Coding

Current Guidelines and Terminology	Sepsis	Septic Shock
1991 and 2001 consensus terminology[9,10]	Severe sepsis Sepsis-induced hypoperfusion	Septic shock[13]
2015 Definition	Sepsis is life-threatening organ dysfunction caused by a dysregulated host response to infection	Septic shock is a subset of sepsis in which underlying circulatory and cellular/metabolic abnormalities are profound enough to substantially increase mortality
nical ia	Suspected or documented infection and an acute increase of ≥2 SOFA points (a proxy for organ dysfunction)	Sepsis[a] and vasopressor therapy needed to elevate MAP ≥65 mm Hg and lactate >2 mmol/L (18 mg/dL) despite adequate fluid resuscitation[13]
mended y ICD		
-9	995.92	785.52
D-10[a]	R65.20	R65.21
ramework for implementation for coding and research	Identify suspected infection by using concomitant orders for blood cultures and antibiotics (oral or parenteral) in a specified period[b] Within specified period around suspected infection[c]: 1. Identify sepsis by using a clinical criterion for life-threatening organ dysfunction 2. Assess for shock criteria, using administration of vasopressors, MAP <65 mm Hg, and lactate >2 mmol/L (18 mg/dL)[d]

Pancreatology 19 (2019) 488–499

Table 1
Summary of the consensus statements.

	Statements	Grade of evidence	Level of agreement
1	There is a general overuse of antibiotics in AP, therefore, centres should make a strong effort to reduce it to a justifiable level.	1C	full (99%)
2	CRP and WBC values are not associated with infection in the early phase of AP, therefore CRP and WBC should not be used as biomarkers for decision making concerning AB therapy in the early phase of AP.	1C	full (97%)
3	Progressive elevation of CRP is part of the inflammatory response in AP, therefore, an upward trend of CRP levels should not be an indicator for AB treatment in the early phase of AP.	1C	full (97%)
4	Elevation of PCT levels during the early phase of AP is associated with infection, therefore, it can guide the choice to start antibiotic treatment in the absence of proven infection.	2C	full (96%)

Why „almost” septic shock?

NE: 0.5γ
Lac: 4.6 mmol/L

FiO_2: 0.6
PEEP: 12 cmH_2O

Is there infection?

Let’s do a trial!

Multimodal, individualized approach in acute pancreatitis caused multiple organ dysfunction to reduce unnecessary antibiotic treatment

Background

PROBLEM

- **ANP in 5%** requires ICU admission due to **MOF:** mortality **35-65%** [1, 2]
- MOF is due to: **dysregulated host response**
- **SSC: immediate AB** administration is **strongly** recommended [3]

WHAT WE ALREADY KNOW?

- Global **overuse** of ABs in ANP **31-82%** [2]
- **Infective** AP accounts only for **5%** [4,5,6]
- **PCT-guided** AB therapy on ICU reduce [7]:
  - AB duration by 2 days
  - Mortality by 16%

[1] Pazmany et al. 2025, Pancreatol.
[2] Parniczky et al. 2019, Pancreatol
3] Evans et al. 2021, ICM
[4] Boxhooorn et al. 2021 NEJM

MISSING LINK

- What is the **real incidence** of **infective-ANP** on ICU admission due to **MOF**?
- Can **a holistic approach** [8] (Clinical+PCT+Micro) help to **individualize** AB therapy?

[5] Siriwardena et al. 2022, Lancet GastroHep
[6] Trikudanathan et al. 2019, Gastroenterol
[7] Papp et al. 2023, Crit Care
[8] Fazakas et al. 2016, Annual Update

AIMS

To investigate whether **a multimodal, individualized approach** can avoid unnecessary AB therapy in **ANP-MOF**

ANP *– Acute Necrotising Pancreatitis*
MOF *– Multiple Organ Failure*
ICU *– Intensive Care Unit*
SSC*: Surviving Campaign Guideline*
AB *- Antibiotics*
PCT *– Procalcitonin*

Research question

Can a multimodal, individualized approach reduce the overuse of antibiotics in patients with ANP induced MOF?

P: Patients with ANP+MOF admitted to ICU

I: Multimodal, individualized approach*

C: Conventional AB therapy

O1: TBD (Length of AB treatment, Complication rate?)

O2: Mortality, Length of ICU stay, recurrent infections

Hypothesis: This approach will result in shorter AB treatment without worsening clinical outcomes

*Organ function and PCT level changes + Microbiology on day 2-3

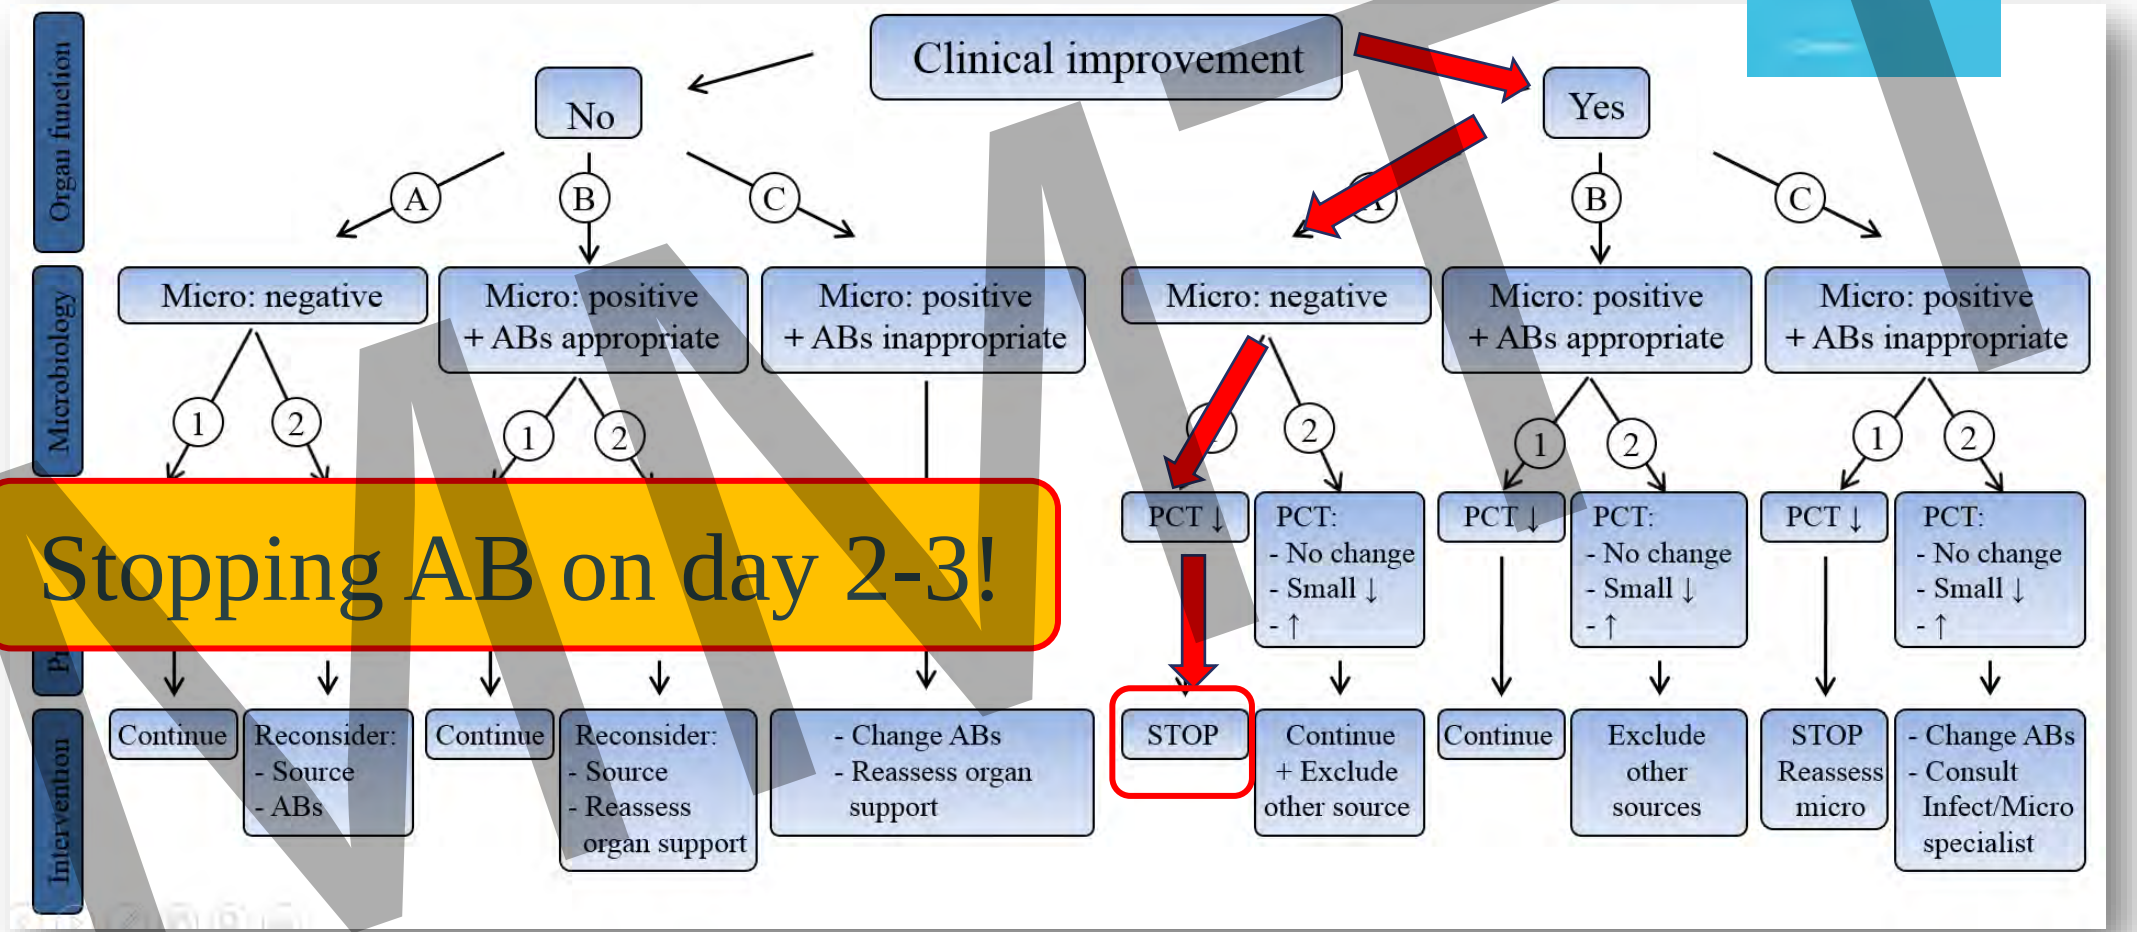
ANP *– Acute Necrotising Pancreatitis*
MOF *– Multiple Organ Failure*
ICU *– Intensive Care Unit*
AB *- Antibiotics*
PCT *– Procalcitonin*

The flow

1. All included patients AB on day 1
2. C-group: min of 7 days TBD with infectologists
3. T-group: re-evaluation on day 2 or 3

Interpreting Procalcitonin at the Bedside

J. Fazakas, D. Trásy, and Z. Molnár



Stopping AB on day 2-3!

Take home message

- High risk of unnecessary AB admininstration
- There is no data on the incidence of infected ANP on ICU
- No reliable markers of infection in ANP-MOF
- Give AB for the time being!
- BUT, no way out: a ICU-RCT is not just a possibility, but a MUST!

Mark it in your calendar!
